

FFF: Run-of-river vs Pondage | CAPEX = NTD 9.7B (upper bound)

Black contour = $P(NPV > 0) = 50\%$ (breakeven boundary). Green = majority viable; red = majority loss.

Y-axis: within-year CV of daily flow (proxy for climate variability). Historical CV range: 1.5–2.5.

FFF boundary defined as $P(NPV > 0) = 0.50$. Two-layer bootstrap: block resample (Layer 1) + CV scaling (Layer 2).

Arnell (1998); Shiau & Huang (2014); Tung et al. (2016); IPCC AR6 Ch.11 (2021).

CAPEX shown in title; PPA = NTD 6.0/kWh; LTV = 80%; equity rate = 8%; project life = 35 yr.
